

Pet Parent Guide for RediHeal Dental Extraction Home Care

3 Ways RediHeal Dental Extraction Packing Keeps Pet Mouths Happy

RediHeal Dental Care heals dental procedures faster with fewer complications.

Dental extractions are a reasonably common surgery in our furry friends, but that doesn't make them any less serious. Most people are aware that dogs, especially larger breeds, tend to have large teeth with long roots – making those teeth a challenge to remove. But even smaller patients may have complicated procedures with multiple extractions or larger back teeth extractions needed.

That's where RediHeal Dental Care comes in. RediHeal Dental is a biological fiber that contains natural ingredients (not antibiotics or steroids) which stimulate the body's healing response. When packed into an extraction site, RediHeal Dental creates an environment which:

-  **Promotes rapid healing.** The soft tissue in extraction sites often heals 30-50% faster when packed with RediHeal Dental, vs. leaving the site unfilled.
-  **Stimulates bone growth.** Often a deeper extraction may disturb the healthy bone a tooth is near. RediHeal helps that bone to regrow with new, healthy bone - so there are no "weak" spots in your pet's mouth.
-  **Minimizes infection potential and fistulas.** Mouths are dirty! RediHeal, though, provides anti-microbial protection - preventing painful, costly complications in your pet's mouth later.

What do you need to do now?

At this point, all you need to do is follow your vet's recommended care protocol. RediHeal is fully resorbed into the body, meaning it will not have to be removed in the future.
